The present invention relates to single exon nucleic acid probes for measuring human gene expression in a smalle derived from human heart. The present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in smaples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging,
                                                                                                                                            measuring human gene expression in a sample derived from human foetal liver. The single acon muclaic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human probe a liver. The present sequence is a single exon nucleic acid human probe of the invention.

Note: The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at firs, wipo.int/pub/published_pot_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The number of the probes for measuring gene waysession in a sample derived from human brease and BT 47 to call a The method involves contacting the probes with a collection of detectably labelled mucleic acting derived from mRM. Cf burn brease is an offer set and the probes with a collection of detectably labelled mucleic acting derived from mRM. Cf burn breast in the probes in the labelled bound to cash probe of the microarray of the probes read for contact of microarray of proposal press for seasons of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention provides a number of single exon nucleic acid probes with are derived from genomic sequences expressed in the humb brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosts and improved treatment of nervous system diseases such as Althemer's disease, multiple solerosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the
                                Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO att ftp.wipo.im/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Single exon nucleic acid probes for analyzing gene expression in human

```
probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leuksemia and myeloma. The present sequence is one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention provides a number of single exon nucleic acid
                                                                                                                                                                                                                                                                                                                                                  Human; bone marrow expressed exon; gene expression analysis; probe; microarray; cancer; leukaemia; lymphoma; myeloma; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human bone marrow
                                                                                                                                                                                                                                                                                                    Human bone marrow expressed single exon probe SEQ ID NO: 16565.

                                                                                                                                                                                                                                                                                                                                                          The present invention relates to single exon nuclaic acid probes (SENP). The proses requerce is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placents. The probes are useful for antenateal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel single exon nucleic acid probe used to measuring gene expression in a human breast -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Probe #8437 used to measure gene expression in human breast sample

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to human single exon nucleic acid probes (ESMP). The present sequence is one such probe. The SEMPs are derived from human HeLe colls The SEMPs can be used to produce a single exon successive, which can be used for measuring human gene expression in sample exon human cervical epithelial calls. By measuring one expression, the probes are therefore univil in grading and/or staging one of diseases of the cervix, notably cervical center.

Note: The sequence date for this parent did not form part of the printed specification, but was obtained in electronic forms threatly from Parto
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Probe #16761 used to measure gene exprension in human placenta sample.

probes, the movel set of probes which hybridisate at high extingency to a probes; the movel set of probes which hybridisate at high extingency to a muchair acid expressed in the human lung; measuring gene expression in a sample derived from human lung, comprising of a conlection of detecrably labeled microlar acids derived from human lung man, and of lone measuring the label detecrably bound to each probe of the array identifying exons in a entartyotic genome, comprising of the array identifying exons in a entartyotic genome, comprising of the array identifying exons in a less one exon from genomic equences of the entartyote; and (b) detecriby bend to each probe of the entartyote; and (b) detecriby genomic esquences of the entartyote; and (b) detecriby genomic acids from entartyote lung mith, to a single exon probe in included to manufacturing a fragment identical to the predicted exon, the probe is included to comprising (a) identifying exons from genomic sequence by the method comprising (a) identifying exons from genomic sequence by the method comprising (a) identifying exons from genomic sequence by the method comprising (a) identifying exons from genomic sequence by the method comprising (b) identifying exons in several tissues and/or cell types using hybridisation to a single exon in several compression of the exons in the tissues and/or cell types indicates that the exons method exons in the tissues and/or cell types indicates that the exons and the exons in experience of the exons in the tissues and/or cell types indicates that the exons and expenses and exons in the tissues and/or cell types indicates that the exons in experses in the tissues and/or expenses in the tissues and/or expenses and the exons in the tissues and/or expense in th
                                                 The invention relates to a spatially-addressable set of single exon 
the probes for measuring gene expression in a sample derived 
from human lump comprising single exon nucleic acid probes having one of 
12814 nucleic acid sequences mentioned in the specification, or their 
complements or the 1289 open reading frames derived from the 12614
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               haemosiderosis pulmonary histicorytosis, lymphangioleiomyomtosis, pulmonary alveolar proteinosis, faragemer syndrome, fibrocystic pulmonary alveolar proteinosis, faragemer syndrome, fibrocystic and hyaline membrane disease. The present sequence is a single exon probe open reading frame of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Probe #14365 for gene expression analysis in human cervical cell sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               the Robins amount of assistance of assistance of 12011 sequences, mentioned in the specification, or encoded by the probes/open reading frames (ORP). The probes are used for gene expression analysis, and for identifying exons in a gene, particularly using human lung derived mRNA and for the study of lung diseases such as asthma, lung cancer, chronic obstructive pulmonary diseases (CORD), interstitial lung diseases (LORD), familial didopathic pulmonary fithrosis, naurefithromatoris tuberous sclerosis (Gubb), interstitial aung disease (LORD), familial didopathic pulmonary Niemann-Pick disease, Hermansky-Pudlak syndrome, sarcoidosis pulmonary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Probe, human; microarray; gene expression; cervical epithelial cell;

                                                                  The present invention relates to novel single exon nucleic acid probes. The proses are useful for messuring bunan gene expression in a human breast sample, where the probe hybridises at high extrigency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic actiology. The diseases include breast, cancer, disorders of development, inflammatory diseases of the breast, fibrocystic changes, proliferative breast diseases and carcinoma tunours.
                                                                                                                                                                                                                                                                                                      Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Spatially-addressable set of single exon nucleic acid probes, used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          pollmonary histicoyrcsis; lymphangiolaiomyomcosis; Karagener syndrome; pulmonary alveolar proteinosis; Ebrocystic pulmonary dysplasia; primary cilary dystinesis; pulmonary hypertension;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   g
```

```
The present sequence is one such probe. The probes are useful for measuring human gene expression in a human breast cample, where the probe hybridises at high stringency to a nucleic acid expressed in the human byeast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic aetiology. The diseases include breast cancer, disorders of development, inflammatory diseases in the breast, disorders of development, inflammatory diseases of the breast, disorders of development.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; Mink2; potassium channel; cardiac arrhythmia; hypertension; ds;
angina asthma; disbetes; renal insufficiency; unrary inconfinence
tritleble colon; epilepey; cerebrovascular isofonamia; autofamune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                        non-carcinoma tumours.
Note: The sequence data for this patent did not form part of the printed
specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                        present invention relates to novel single exon nucleic acid probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel potassium channel gene termed Mink2 encoding potassium channel regulatory protein, useful for screening compounds that are useful for
                                                                                                            Novel single exon nucleic acid probe used to measuring gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human potassium channel regulatory protein, Mink2, DNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Score 21; DB 22; Length 372;

decemining predisposition and/or prognosing beaut disease conse-
expression analysis is useful for assessing the toxicity of chemical
agence ocalls. The microarray of this invention presents a far greater
diversity of probe for measuring gene expression, with far less blus
there age of probes of measuring gene expression is suitable for
rapid approduction of functional information from agenuic sequence. The
present sequence is a single exon muchaic acid probe of the invention
byte: The sequence asks for this patent did not form part of the
princed specification, bour was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, foetal liver, gene expression; single exon nucleic acid probe; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample detrived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Note: The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ttp. wipo.int/pub/published_pet_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      fetal liver. The present sequence is a single exon nucleic acid probe of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 1; SEQ ID NO 3557; 639pp + sequence listing; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                      The sequence represents the coding sequence of human potassium channel regulatory protein, Mikz, Bequence is useful for producing a pocassium channel regulatory protein useful for in vitro or in vivo screening of agonistic or antegonistic compounds that are useful for treating of agonistic or antegonistic compounds that are useful for treating diseases caused by aberrant potassium activity, such as human cardiac arrhythmias, hypertension, angina, asthma, diabetes, renal insufficiency, unitary incontinence, riritable ocion, epilepsy, errebackorsecular ischaemia, and autorimment disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting the probes with a collection of detectably labelled mulcipic acids derived from RNM of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for verifying the expression of ragions of genenic RNM predicted to emode proteins. They are useful for yearlying the expression of ragions of genenic RNM predicted to
                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New spatially-addressable set of single exon nucleic acid probes, useful for measuring gene expression in sample derived from human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to single exon nucleic acid probes for measuring human gene expression in a supple derived from human heart. The present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnoshing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease. Mypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed pecification, but was obtained in electronic format directly from WIPO at the Varyonint published_pct_sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Single exon nucleic acid probes for analyzing gene expression in human
